

# A Secure and User-Friendly Encrypted File Sharing System

In today's digital world, file sharing is common but prone to data breaches. This project provides a secure and simple encrypted file sharing solution.

**Team Members:** ABHIMANYU LOCHAB [24BCY70093] , RAGHAV TIWARI [24BCY70096] , PARAS SHARMA[24BCY70123],DILPREET SINGH[24BCY70106] , VANSH GOLIA[24BCY70087]

**Guide:** DR. SYED IRFAN YAQOOB

# System Architecture Overview

**User Upload**

**AES-256 Encrypt**

**Encrypted Storage**

**Generate Secure Link**

## User Interface

Intuitive design for seamless file upload and download operations.

## Encryption/Decryption

Utilising robust AES-256 for military-grade data protection.

## Secure Link Generation

Links are protected with passwords and time-based expiry for enhanced security.

## File Retrieval

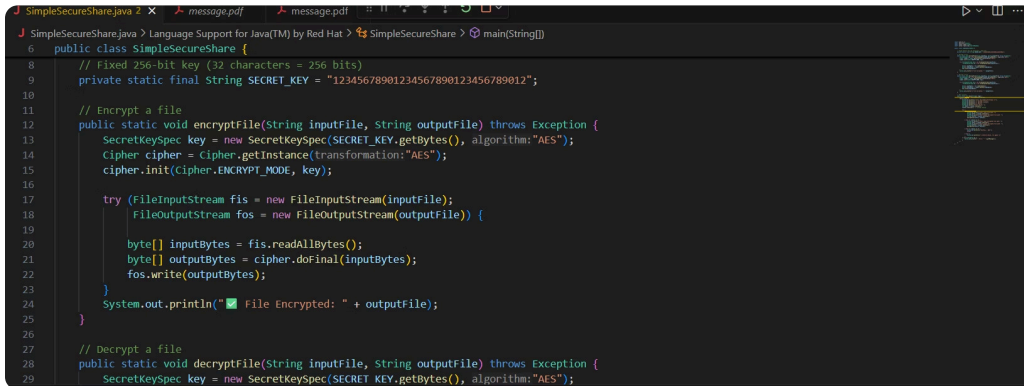

Efficient and secure access to encrypted files by authorised receivers.

# Experimental Setup and Workflow

## Setup Design

Our experimental setup leverages readily available resources to ensure replicability and accessibility.

- **Hardware:** Standard laptop/PC configuration.
- **Software:** Java JDK, VS Code, and standard AES cryptography libraries.

```
SimpleSecureShare.java X message.pdf message.pdf
J SimpleSecureShare.java > Language Support for Java(TM) by Red Hat > SimpleSecureShare > main(String[])
6 public class SimpleSecureShare {
7     // Fixed 256-bit key (32 characters = 256 bits)
8     private static final String SECRET_KEY = "12345678901234567890123456789012";
9
10
11     // Encrypt a file
12     public static void encryptFile(String inputFile, String outputFile) throws Exception {
13         SecretKeySpec key = new SecretKeySpec(SECRET_KEY.getBytes(), algorithm:"AES");
14         Cipher cipher = Cipher.getInstance(transformation:"AES");
15         cipher.init(Cipher.ENCRYPT_MODE, key);
16
17         try (FileInputStream fis = new FileInputStream(inputFile);
18             FileOutputStream fos = new FileOutputStream(outputFile)) {
19
20             byte[] inputBytes = fis.readAllBytes();
21             byte[] outputBytes = cipher.doFinal(inputBytes);
22             fos.write(outputBytes);
23         }
24         System.out.println("🟢 File Encrypted: " + outputFile);
25     }
26
27     // Decrypt a file
28     public static void decryptFile(String inputFile, String outputFile) throws Exception {
29         SecretKeySpec key = new SecretKeySpec(SECRET_KEY.getBytes(), algorithm:"AES");
```

## Workflow Illustration

The system's core functionality is demonstrated through a simple, yet effective, file sharing process.

1. User A uploads a document.
2. The system encrypts the document.
3. A secure, time-limited link is generated.
4. User B downloads and decrypts the document via the link.

**Demo:** We will provide a live demonstration, showcasing the upload, encryption, download, and decryption process, highlighting the seamless user experience.

# Research Methodology and Data Collection

01

---

## Literature Survey

Extensive review of cryptographic standards (AES vs DES) and existing secure file sharing platforms to inform design choices.

02

---

## AES-256 Adoption

Selected AES-256 for its superior security posture and widespread industry endorsement.

03

---

## Java Implementation

Developed the system in Java, focusing on a straightforward user interface for ease of use.

04

---

## Comprehensive Testing

Rigorous testing with diverse file types and sizes to assess system performance and robustness.

## Data Collection Plan

- **Performance Metrics:** Recording encryption and decryption times for various file sizes.
- **Efficiency Analysis:** Comparing original and encrypted file sizes to evaluate overhead.
- **Usability Feedback:** Gathering qualitative data on ease of use from team members to refine the user experience.

# Feasibility Analysis

## Technical Feasibility

The system operates efficiently on standard computing hardware and utilises established software frameworks.

- Compatible with standard laptops and PCs.
- Relies on proven open-source tools and libraries.

## Scalability Potential

The architecture supports future expansion with new features and integrations, enhancing its utility and reach.

- Supports multi-user environments.
- Adaptable for blockchain logging and mobile applications.

## Economic Viability

Designed with a focus on cost-effectiveness, eliminating the need for proprietary software or additional hardware investments.

- Zero additional financial outlay for implementation.
- Leverages open-source resources for development.

## Operational Ease

Engineered for simplicity, ensuring accessibility for users across all technical proficiencies.

- User-friendly interface for non-technical users.
- Streamlined workflow for sharing and retrieving files.

# Innovations and Future Enhancements

## Current Innovations

- **AES-256 Encryption:** Ensuring data confidentiality and integrity.
- **Time-Limited Links:** Enhancing security by restricting access duration.
- **Password Protection:** Adding an extra layer of authentication for shared files.

## Future Work

- **Role-Based Access Control (RBAC):** Granular permissions for diverse user roles.
- **Blockchain Integration:** Tamper-proof logging for all file transactions.
- **Generate link:** Create a link to share the files more efficiently
- **Mobile Application:** Extending secure file sharing to mobile platforms.

# Conclusion and Vision

**"This project is not just a prototype, but a step towards building secure, practical, and user-friendly file sharing systems."**

We have developed a robust, accessible, and highly secure encrypted file sharing system, demonstrating a significant leap in data protection for everyday digital interactions. Our foundational work provides a strong platform for future innovations, ensuring adaptability and enhanced functionality in an evolving digital landscape.
